APPLICATION NOTES

Auto Restart Protection

When the fan motor is locked by an external force, the device will temporarily turn off electrical power to the motor and restart automatically when the locked rotor condition is released.

Polarity Protection

Able to withstand 10 minutes of reverse polarity connection between the positive and negative wires without causing damage.

Tachometer Signal (Yellow Wire)

The tachometer signal is for detecting the rotational speed of the fan motor. The output will be a square wave when fan is operating and V_{FG} or V_{CE} depending on the locked rotor position when fan motor is locked (See Figures 1~2 below).

Figure 1: Tachometer Output Circuit

Figure 2: Tachometer Output Waveform

PWM Signal (Blue Wire)

This wire is for speed control of the fan motor using a PWM input signal from the customer circuit (See Figure 3 below).

Figure 3: PWM Input Signal

$$\text{PWM Duty Cycle (\%)} = T_1/T \times 100\%$$

PWM Frequency Range: 20~30 kHz

PWM VIH = 2.8~5.5 V

PWM VIL = 0~0.6 V

Soft Start

When the fan power is on, the current will increase slowly (~15 seconds) until the fan reaches the rated speed.
